Abstract
There is a moral imperative to do one’s best when making high-consequence decisions for defense and security. However, our understanding is often wrong and we are frequently surprised. Using our faulty models in trying to optimize policy outcomes is infeasible, even irresponsible. The practical implication of severe uncertainty is that we must ask: What outcomes are required? What performance is essential? How can we be robust against surprise? We describe the methodology of info-gap decision theory, and consider several examples: the US decision to invade Iraq in 2003, force development planning, and intelligence assessment for policy support.
